LEADERSHIP DECISION PAPER

Kupferkanne: win-back discount allocation

Test a 15% rate for Hibernating in a controlled pilot with holdouts before the playbook changes.

EXECUTIVE SUMMARY

Test a 15% rate for Hibernating in a controlled pilot with holdouts before the playbook changes.

At Risk and Hibernating: 26.1% of scored customers, 2.0% of the revenue base.

PROBLEM

20%

off for Hibernating (46.69% margin), against 15% for At Risk (51.97%).

CAUSE

1.85×

as much per euro of discount in At Risk at the playbook's rates; about 1.2× at either common rate.

UNCERTAINTY

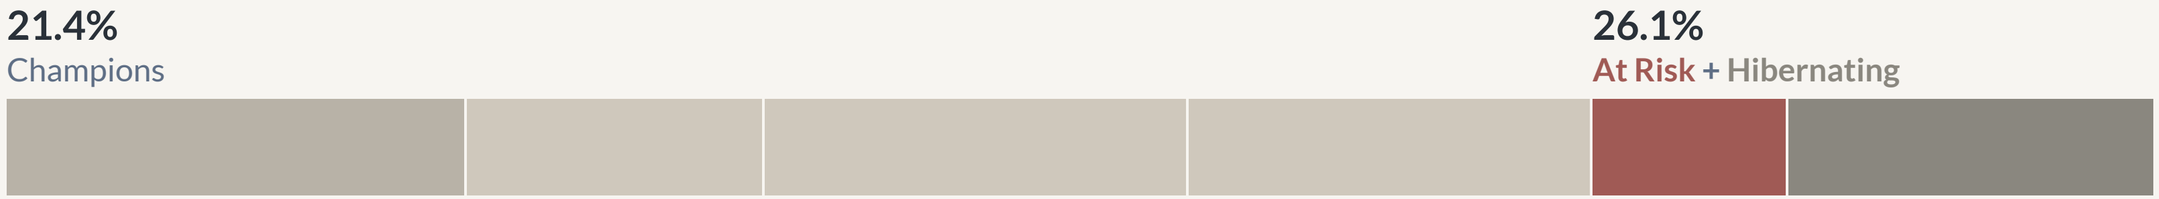

Modelled

Margin efficiency once an order is placed, not incrementality: the ranking can narrow or reverse.

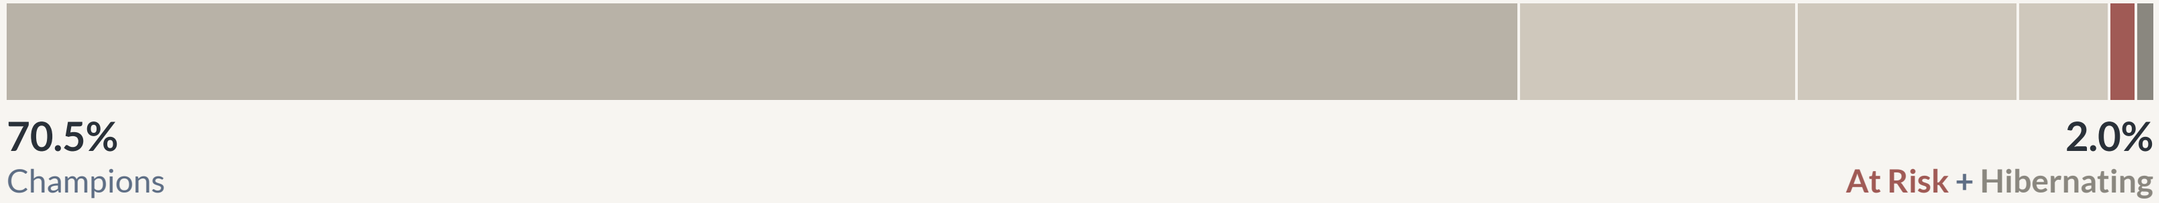

Source: README.md, docs/methodology.md

The win-back pool is broad but shallow: 26.1% of scored customers, 2.0% of the revenue base.

SHARE OF SCORED CUSTOMERS

SHARE OF THE REVENUE BASE

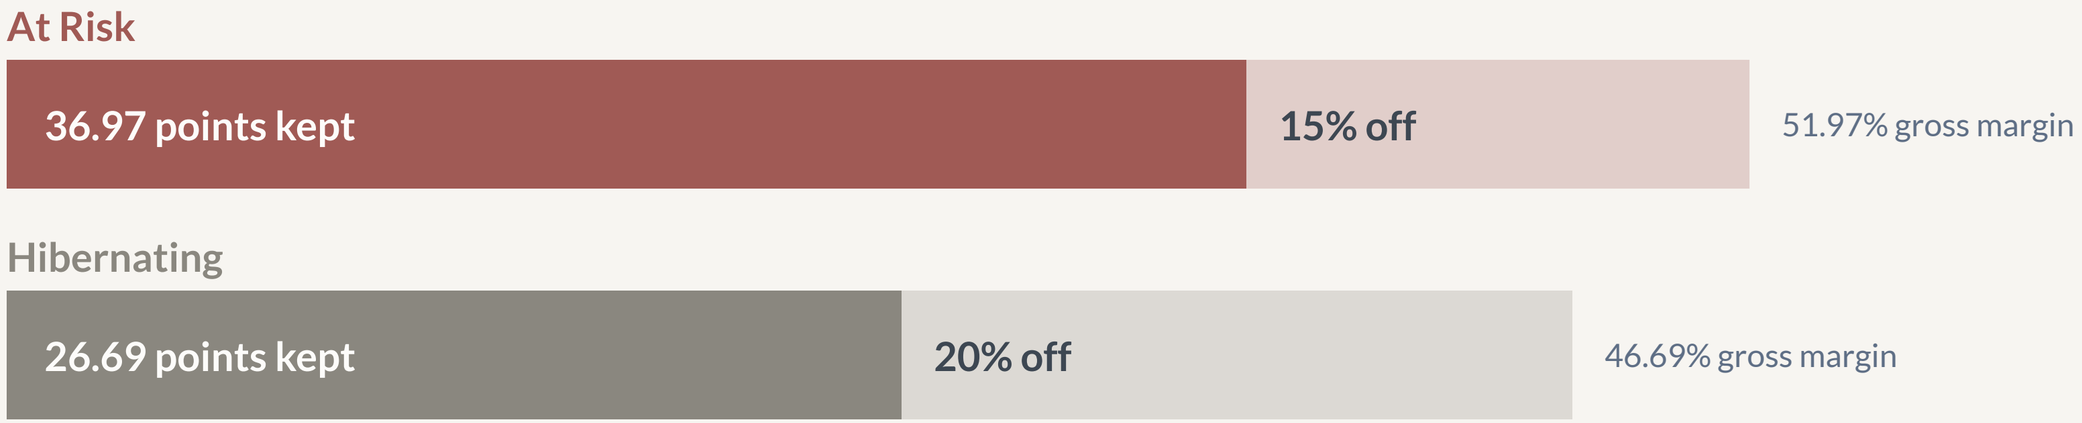

Light grey: other segments.

The playbook's budget shares bound any move: Low (7%) for At Risk, Minimal (3%) for Hibernating.

Source: docs/methodology.md, Appendix: segment shares

The playbook gives its deepest discount, 20%, to its thinnest margin, Hibernating at 46.69%.

Points of pre-offer order value: kept as contribution or given as discount

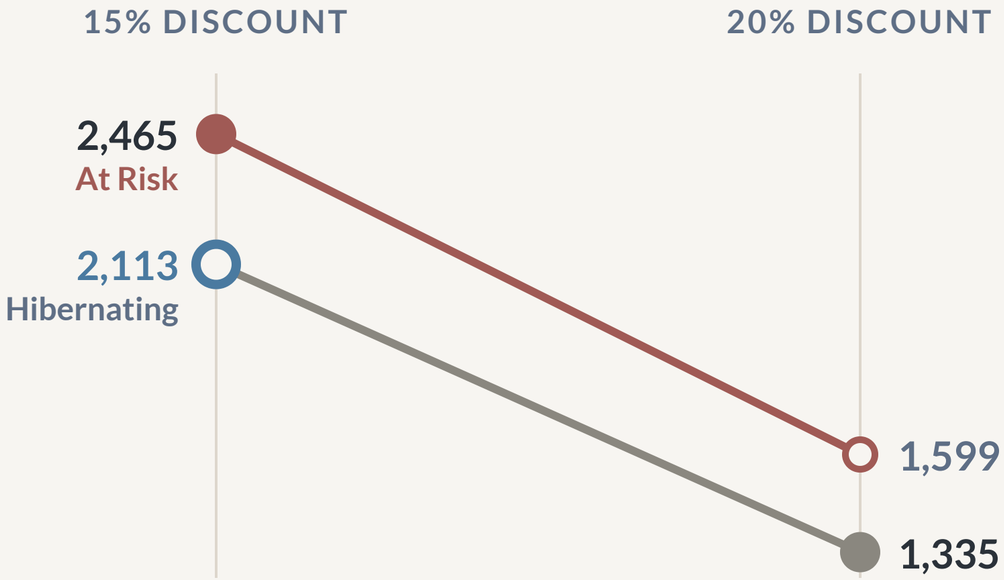

Gross margin falls with each step down the composite score: 61.11% for Champions, 46.69% for Hibernating.

Source: docs/methodology.md, Win-back discount allocation

The per-euro gap comes mostly from the rates: at either common rate, At Risk retains about 1.2× as much.

Contribution (€) per €1,000 of discount, on orders placed

Filled: the playbook's rates; blue ring: under test.

1.85×

in At Risk at the playbook's rates

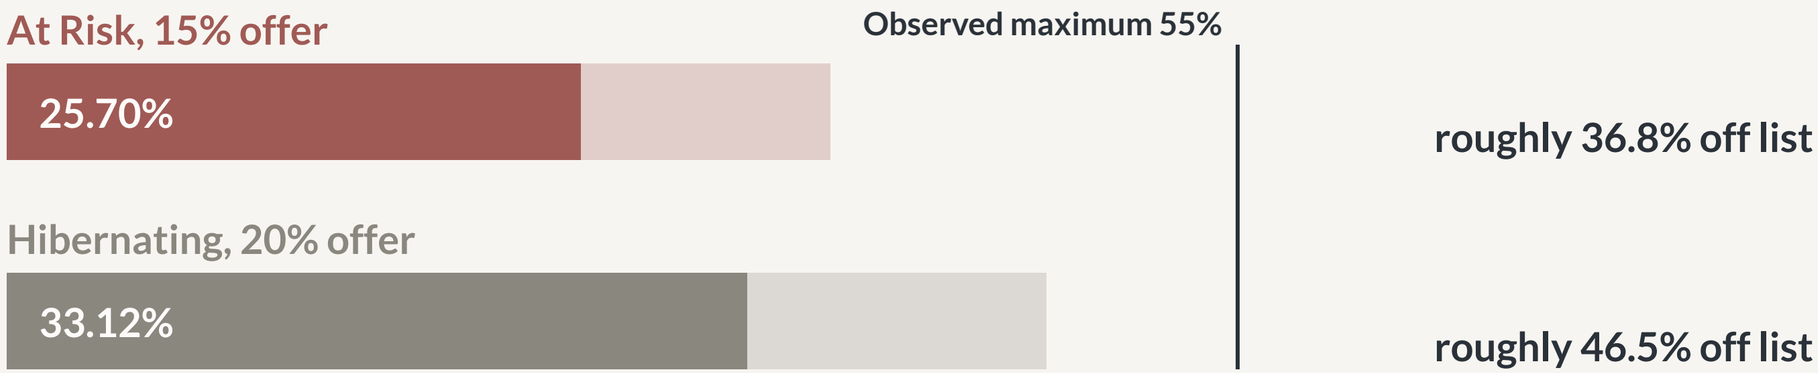

about 1.2×

at either common rate

Source: docs/methodology.md, Win-back discount allocation

The figures measure margin efficiency once an order is placed, not incrementality, so the ranking can narrow or reverse.

Dark: mean realised discount today; light: the offer on top.

NOT INCREMENTAL

At Risk customers may have ordered anyway: part of the discount is deadweight.

Source: docs/methodology.md, Limitations

A controlled pilot with holdouts tests Hibernating's rate first; an unresolved interval keeps the playbook.

At Risk		Hibernating		
Offer 15% playbook rate	**Holdout** no offer	**Offer 20%** playbook rate	**Offer 15%** rate under test	**Holdout** no offer

DECISION RULE

Fixed before launch: rate first, then each offer against break-even, then priority if the budget is short. Thresholds: Appendix A4.

Source: docs/methodology.md, Pilot design

Approve the pilot and fix its group shares, observation window and contact-cost recording before launch.

Approve the pilot

Group shares

Fixed before launch across the five groups.

Observation window

Set before launch; customers without an order count at zero.

Contact-cost recording

Per contacted customer. At the 10% planning rate, contribution is exhausted at €1.49 (At Risk) and €0.67 (Hibernating) per contact.

Source: docs/methodology.md, Cost basis, Pilot design

APPENDIX A1

Derivation of the per-euro figures and the contact-cost basis

At the playbook's rates. Amounts in €; kept = points of order value left as contribution after the discount.

Segment	Revenue A	Profit B	Gross margin C = B ÷ A	Discount D	Kept, pts E = C − D	Per euro F = E ÷ D	AOV G	Per order H = E × G	Contact cost I = H ÷ 10
At Risk	106,109.36	55,146.16	51.9711%	15%	36.97	**2.4647**	40.28	14.89	**1.49**
Hibernating	64,699.38	30,208.48	46.6905%	20%	26.69	**1.3345**	25.00	6.67	**0.67**

AOV = revenue ÷ orders (2,634 and 2,588 orders). Contact cost at which contribution is exhausted: H ÷ 10 contacts, at the What-If default reactivation rate of 10% (a planning assumption, not a measured rate) and one recovered order per reactivated customer. Contact, send and fulfilment costs are not in the data.

Per euro of discount	At 15%	At 20%
At Risk	2.46	1.60
Hibernating	2.11	1.33

1.85× along the playbook's rates: 2.4647 ÷ 1.3345.

About 1.2× at either common rate, reading down a column.

Segment colour: the playbook's rates. Blue: the rate under test. Multiplied by 1,000, the playbook figures are the €2,465 and €1,335 per €1,000 of discount on the slides.

APPENDIX A2

Segment shares of scored customers and of the revenue base

Bars use one scale for both shares. Shares are rounded; subtotals use unrounded values.

Segment	Customers	Share of scored customers	Lifetime spend (€)	Share of revenue base
Champions	3,209	21.44%	5,973,272.78	70.47%
Loyal Customers	2,077	13.88%	1,096,121.16	12.93%
Potential Loyalists	2,955	19.74%	874,921.68	10.32%
Recent Customers	2,817	18.82%	361,076.38	4.26%
At Risk	1,365	9.12%	106,109.36	1.25%
Hibernating	2,544	17.00%	64,699.38	0.76%
At Risk + Hibernating	**3,909**	**26.12%**	**170,808.74**	**2.02%**
Total	**14,967**	**100.00%**	**8,476,200.74**	**100.00%**

Source: docs/methodology.md, Appendix: segment shares; v_rfm_for_bi at the segment snapshot

APPENDIX A3

Data and method

SCALE

14,967 scored customers; **168,777** orders; revenue base **€8,476,200.74**, profit margin **59.52%**

DATA AND PIPELINE

Roughly **462K** raw records, synthetic and regenerable; a ten-step BigQuery SQL pipeline plus two views

MODEL AND SEGMENTS

Power BI, **105** DAX measures; segments are a single snapshot, so migration is not computable

OPEN ISSUE

646 of 168,777 orders fall outside the 0.001 order-value tolerance; unexplained and tracked

Source: README.md and docs/methodology.md (Limitations), public project repository

APPENDIX A4

Pilot decision rule and statistics

DECISION RULE

STAGE 1: RATE

Hibernating moves to 15% only if the interval for 15% minus 20% lies above zero

STAGE 2: FLOOR

An offer stops only if the upper bound of its interval lies below break-even

STAGE 2: PRIORITY

If the budget is short, At Risk goes first only if its lower bound clears break-even and beats Hibernating

STATISTICS

INTERVALS

95% BCa bootstrap intervals that resample customers within each segment and group

SCOPE OF THE VERDICT

The verdict holds at the tested rates only

STAGE 1 METRIC

Per euro of discount if the budget cannot cover everyone, else per assigned customer

FIRST WAVE AND DEFAULTS

The first wave sizes the groups and is excluded; every decision defaults to the playbook as it is
